## 2-SUBSTITUTED 4-HETEROARYL-PYRIMIDINES AND THEIR USE IN THE TREATMENT OF PROLIFERATIVE DISORDERS

The present invention relates to 2-substituted 4-heteroaryl-pyrimidines, their preparation, pharmaceutical compositions containing them, and their use in the 5 treatment of proliferative disorders such as cancer, leukemia, psoriasis and the like.

Introduction and Summary of the Prior art

Certain 4,5,6-substituted-N-(substituted-phenyl)-2-pyrimidineamines having anti-10 asthmatic properties are disclosed in EP-A-233,461. Certain 4-heteroaryl-N-(3- substituted-phenyl)-2-pyridineamines possessing anti-proliferative properties and inhibiting protein kinases C, epidermal growth factor receptor-associated tyrosine protein kinase (EGF-R-TPK), as well as CDK1/cyclin B have been disclosed in WO95/09847 wherein the exemplified heteroaryl are pyridyl and indolyl.

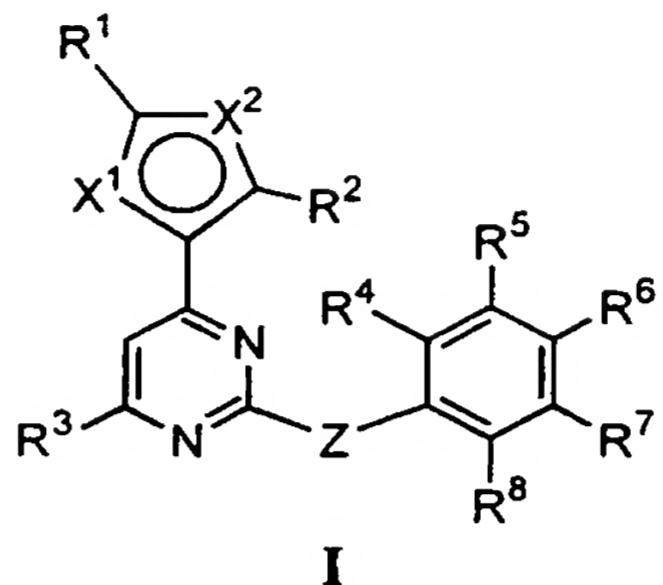

15 J. Med. Chem. (1993) Vol. 36, pages 2716-2725, Paul, R. et al: discloses a further class of phenyl amino-pyrimidines possessing anti-inflammatory activity. These compounds include mono-substituted 2-thienyl groups at the 4-position of the pyrimidine ring and dimethyl-3-furyl groups at this position.

It is an aim of the present invention to provide a further class of N-phenyl-2-20 pyrimidine anti-proliferative compounds. The compounds of the present invention have surprisingly been found to not to be inhibitors of protein kinase C. As discussed hereinafter, their activity may be demonstrated by inhibition of cell proliferation in cell lines and/or inhibition of cyclin dependent kinase enzymes. Throughout the specification, the term "thienyl" is used interchangeably with "thiophene"

amine.

The following compound is observed to be an even more effective anti-proliferative agent, as demonstrated by cell-based assays: [4-(2,4-dimethyl-thiazol-5-yl)-pyrimidin-2-yl]-(4-iodo-phenyl)-amine.

The compounds of formula I have been found to possess anti-proliferative activity and are therefore believed to be of use in the treatment of proliferative disorders such as cancers, leukaemias and other disorders associated with uncontrolled cellular

proliferation such as psoriasis and restenosis. As defined herein, an anti-proliferative effect within the scope of the present invention may be demonstrated by the ability to inhibit cell proliferation in an *in vitro* whole cell assay, for example using any of the cell lines A549, HT29, Saos-2, HeLa or MCF-7, or by showing inhibition of a CDK enzyme (such as CDK2 or CDK4) in an appropriate assay. These assays including methods for their performance are described in more detail in Example 23. Using such cell line and enzymes assays it may be determined whether a compound is anti-proliferative in the context of the present invention.

10 Without wishing to be bound by theory, the compounds of the present invention are believed to exert their anti-proliferative effect in a non-protein kinase C (PKC) dependent manner. Many of the compounds inhibit cyclin-dependent kinase enzymes (CDKs) that have been shown to be involved in cell cycle control. These CDKs include CDK2 and CDK4 and particularly their respective interactions with cyclin E and cyclin D1. These compounds of the present invention are further believed to be advantageous in being selective for CDK enzymes implicated in proliferative diseases. By the term "selective" it is meant that although possible having some inhibitory effect on another enzyme (such as PKC), the compound is preferentially effective against an enzyme implicated in proliferative diseases.

15

20 The compounds of the invention may inhibit any of the steps or stages in the cell cycle, for example, formation of the nuclear envelope, exit from the quiescent phase of the cell cycle (G0), G1 progression, chromosome decondensation, nuclear envelope breakdown, START, initiation of DNA replication, progression of DNA replication, termination of DNA replication, centrosome duplication, G2 progression, activation of mitotic or meiotic functions, chromosome condensation, centrosome separation, microtubule nucleation, spindle formation and function, interactions with microtubule motor proteins, chromatid separation and segregation, inactivation of mitotic functions, formation of contractile ring, and cytokinesis functions. In particular, the

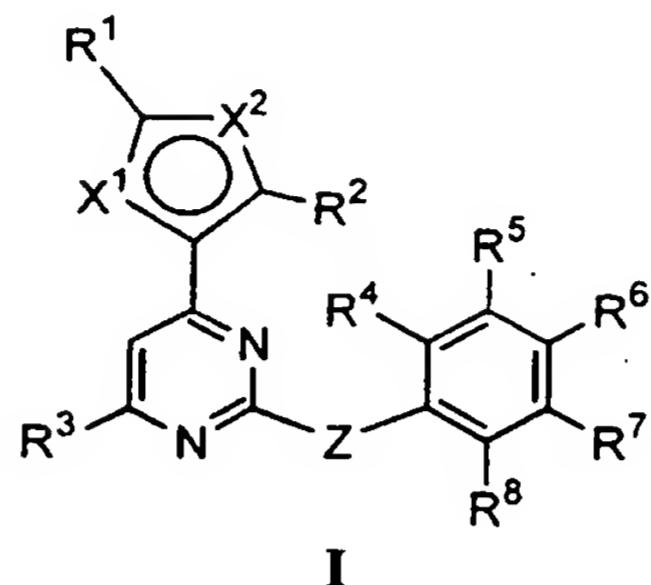

25

compounds of the invention may influence certain gene functions such as chromatin binding, formation of replication complexes, replication licensing, phosphorylation or other secondary modification activity, proteolytic degradation, microtubule binding, actin binding, septin binding, microtubule organising centre nucleation activity and 5 binding to components of cell cycle signalling pathways.

A further embodiment of the present invention therefore relates to the use of one or more compounds of formula I in the treatment of proliferative disorders. Preferably, the proliferative disorder is a cancer or leukaemia. The term proliferative disorder is 10 used herein in a broad sense to include any disorder that requires control of the cell cycle, for example cardiovascular disorders such as restenosis and cardiomyopathy, auto-immune disorders such as glomerulonephritis and rheumatoid arthritis, dermatological disorders such as psoriasis, anti-inflammatory, anti-fungal, antiparasitic disorders such as malaria, emphysema and alopecia. In these disorders, 15 the compounds of the present invention may induce apoptosis or maintain stasis within the desired cells as required.

In a particularly preferred embodiment, the invention relates to the use of one or more compounds of formula I in the treatment of a CDK dependent or sensitive disorder. 20 CDK dependent disorders are associated with an above normal level of activity of one or more CDK enzymes. Such disorders preferably associated with an abnormal level of activity of CDK2 and/or CDK4. A CDK sensitive disorder is a disorder in which an aberration in the CDK level is not the primary cause, but is downstream of the primary metabolic aberration. In such scenarios, CDK2 and/or CDK4 can be said to 25 be part of the sensitive metabolic pathway and CDK inhibitors may therefore be active in treating such disorders. Such disorders are preferably cancer or leukaemic disorders.

A second aspect of the present invention relates to the use of one or more compounds of formula

5

The term "proliferative disorder" has been previously discussed and the same definition applies to the second aspect of the invention.

The preferred embodiments of this further aspect of the invention are identical to

10 those described above in respect of the first aspect.

In a particularly preferred embodiment, the one or more compounds of the invention are administered in combination with one or more other anticancer agents. In such cases, the compounds of the invention may be administered consecutively, 15 simultaneously or sequentially with the one or more other anticancer agents.

As used herein the phrase "manufacture of a medicament" includes the use of a compound of formula I directly as the medicament in addition to its use in a screening programme for further anti-proliferative agents or in any stage of the manufacture of

20 such a medicament.

The compounds of the present invention (first and seconds aspects) can be present as salts or esters, in particular pharmaceutically acceptable salts or esters.

25 Pharmaceutically acceptable salts of the compounds of the invention (first and seconds aspects) include suitable acid addition or base salts thereof. A review of suitable pharmaceutical salts may be found in Berge et al, *J Pharm Sci*, 66, 1-19 (1977). Salts are formed, for example with strong inorganic acids such as mineral acids, e.g. sulphuric acid, phosphoric acid or hydrohalic acids; with strong organic

carboxylic acids, such as alkanecarboxylic acids of 1 to 4 carbon atoms which are unsubstituted or substituted (e.g., by halogen), such as acetic acid; with saturated or unsaturated dicarboxylic acids, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or tetraphthalic; with hydroxycarboxylic acids, for example ascorbic, 5 glycolic, lactic, malic, tartaric or citric acid; with aminoacids, for example aspartic or glutamic acid; with benzoic acid; or with organic sulfonic acids, such as (C<sub>1</sub>-C<sub>4</sub>)-alkyl- or aryl-sulfonic acids which are unsubstituted or substituted (for example, by a halogen) such as methane- or p-toluene sulfonic acid.

10 Esters are formed either using organic acids or alcohols/hydroxides, depending on the functional group being esterified. Organic acids include carboxylic acids, such as alkanecarboxylic acids of 1 to 12 carbon atoms which are unsubstituted or substituted (e.g., by halogen), such as acetic acid; with saturated or unsaturated dicarboxylic acid, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or tetraphthalic; with 15 hydroxycarboxylic acids, for example ascorbic, glycolic, lactic, malic, tartaric or citric acid; with aminoacids, for example aspartic or glutamic acid; with benzoic acid; or with organic sulfonic acids, such as (C<sub>1</sub>-C<sub>4</sub>)-alkyl- or aryl-sulfonic acids which are unsubstituted or substituted (for example, by a halogen) such as methane- or p-toluene sulfonic acid. Suitable hydroxides include inorganic hydroxides, such as sodium 20 hydroxide, potassium hydroxide, calcium hydroxide, aluminium hydroxide. Alcohols include alkanealcohols of 1-12 carbon atoms which may be unsubstituted or substituted, e.g. by a halogen).

In all aspects of the present invention previously discussed, the invention includes, 25 where appropriate all enantiomers and tautomers of compounds of formula I. The man skilled in the art will recognise compounds that possess an optical properties (one or more chiral carbon atoms) or tautomeric characteristics. The corresponding enantiomers and/or tautomers may be isolated/prepared by methods known in the art.

The invention furthermore relates to the compounds of or of use in the present invention (first and seconds aspects) in their various crystalline forms, polymorphic forms and (an)hydrous forms. It is well established within the pharmaceutical industry that chemical compounds may be isolated in any of such forms by slightly varying the method of purification and or isolation form the solvents used in the synthetic preparation of such compounds.

The invention further includes the compounds (first and seconds aspects) of or of use in the present invention in prodrug form. Such prodrugs are generally compounds of formula I wherein one or more appropriate groups have been modified such that the modification may be reversed upon administration to a human or mammalian subject. Such reversion is usually performed by an enzyme naturally present in such subject, though it is possible for a second agent to be administered together with such a prodrug in order to perform the reversion *in vivo*. Examples of such modifications include ester (for example, any of those described above), wherein the reversion may be carried out be an esterase etc. Other such systems will be well known to those skilled in the art.

The present invention also encompasses pharmaceutical compositions comprising the compounds of the invention (first and seconds aspects). In this regard, and in particular for human therapy, even though the compounds of the present invention (including their pharmaceutically acceptable salts, esters and pharmaceutically acceptable solvates) can be administered alone, they will generally be administered in admixture with a pharmaceutical carrier, excipient or diluent selected with regard to the intended route of administration and standard pharmaceutical practice.

Thus, the present invention also relates to pharmaceutical compositions comprising one or more compounds of formula I or pharmaceutically acceptable salts or esters

thereof, together with at least one pharmaceutically acceptable excipient, diluent or carrier.

By way of example, in the pharmaceutical compositions of the present invention, the 5 compounds of the invention may be admixed with any suitable binder(s), lubricant(s), suspending agent(s), coating agent(s), and/or solubilising agent(s). Examples of such suitable excipients for the various different forms of pharmaceutical compositions described herein may be found in the "Handbook of Pharmaceutical Excipients, 2<sup>nd</sup> Edition, (1994), Edited by A Wade and PJ Weller.

10

The pharmaceutical compositions of the present invention may be adapted for oral, rectal, vaginal, parenteral, intramuscular, intraperitoneal, intraarterial, intrathecal, intrabronchial, subcutaneous, intradermal, intravenous, nasal, buccal or sublingual routes of administration.

15

For oral administration, particular use is made of compressed tablets, pills, tablets, gellules, drops, and capsules. Preferably, these compositions contain from 1 to 250 mg and more preferably from 10-100 mg, of active ingredient per dose.

20 Other forms of administration comprise solutions or emulsions which may be injected intravenously, intraarterially, intrathecally, subcutaneously, intradermally, intraperitoneally or intramuscularly, and which are prepared from sterile or sterilisable solutions. The pharmaceutical compositions of the present invention may also be in form of suppositories, pessaries, suspensions, emulsions, lotions, ointments, creams, 25 gels, sprays, solutions or dusting powders.

An alternative means of transdermal administration is by use of a skin patch. For example, the active ingredient can be incorporated into a cream consisting of an aqueous emulsion of polyethylene glycols or liquid paraffin. The active ingredient

can also be incorporated, at a concentration of between 1 and 10% by weight, into an ointment consisting of a white wax or white soft paraffin base together with such stabilisers and preservatives as may be required.

5    Injectable forms may contain between 10 - 1000 mg, preferably between 10 - 250 mg, of active ingredient per dose.

Compositions may be formulated in unit dosage form, i.e., in the form of discrete portions containing a unit dose, or a multiple or sub-unit of a unit dose.

10

A person of ordinary skill in the art can easily determine an appropriate dose of one of the instant compositions to administer to a subject without undue experimentation. Typically, a physician will determine the actual dosage which will be most suitable for an individual patient and it will vary with the age, weight and response of the 15 particular patient. The dosages disclosed herein are exemplary of the average case. There can of course be individual instances where higher or lower dosage ranges are merited, and such are within the scope of this invention.

20    In an exemplary embodiment, one or more doses of 10 to 150 mg/day will be administered to the patient for the treatment of malignancy.

The pharmaceutical compositions of the invention may further comprise one or more additional anticancer agents, for example, existing anticancer drugs available on the market.

25

Anticancer drugs in general are more effective when used in combination. In particular, combination therapy is desirable in order to avoid an overlap of major toxicities, mechanism of action and resistance mechanism(s). Furthermore, it is also

desirable to administer most drugs at their maximum tolerated doses with minimum time intervals between such doses. The major advantages of combining chemotherapeutic drugs are that it may promote additive or possible synergistic effects through biochemical interactions and also may decrease the emergence of resistance in 5 early tumor cells which would have been otherwise responsive to initial chemotherapy with a single agent. An example of the use of biochemical interactions in selecting drug combinations is demonstrated by the administration of leucovorin to increase the binding of an active intracellular metabolite of 5-fluorouracil to its target, thymidylate synthase, thus increasing its cytotoxic effects.

10

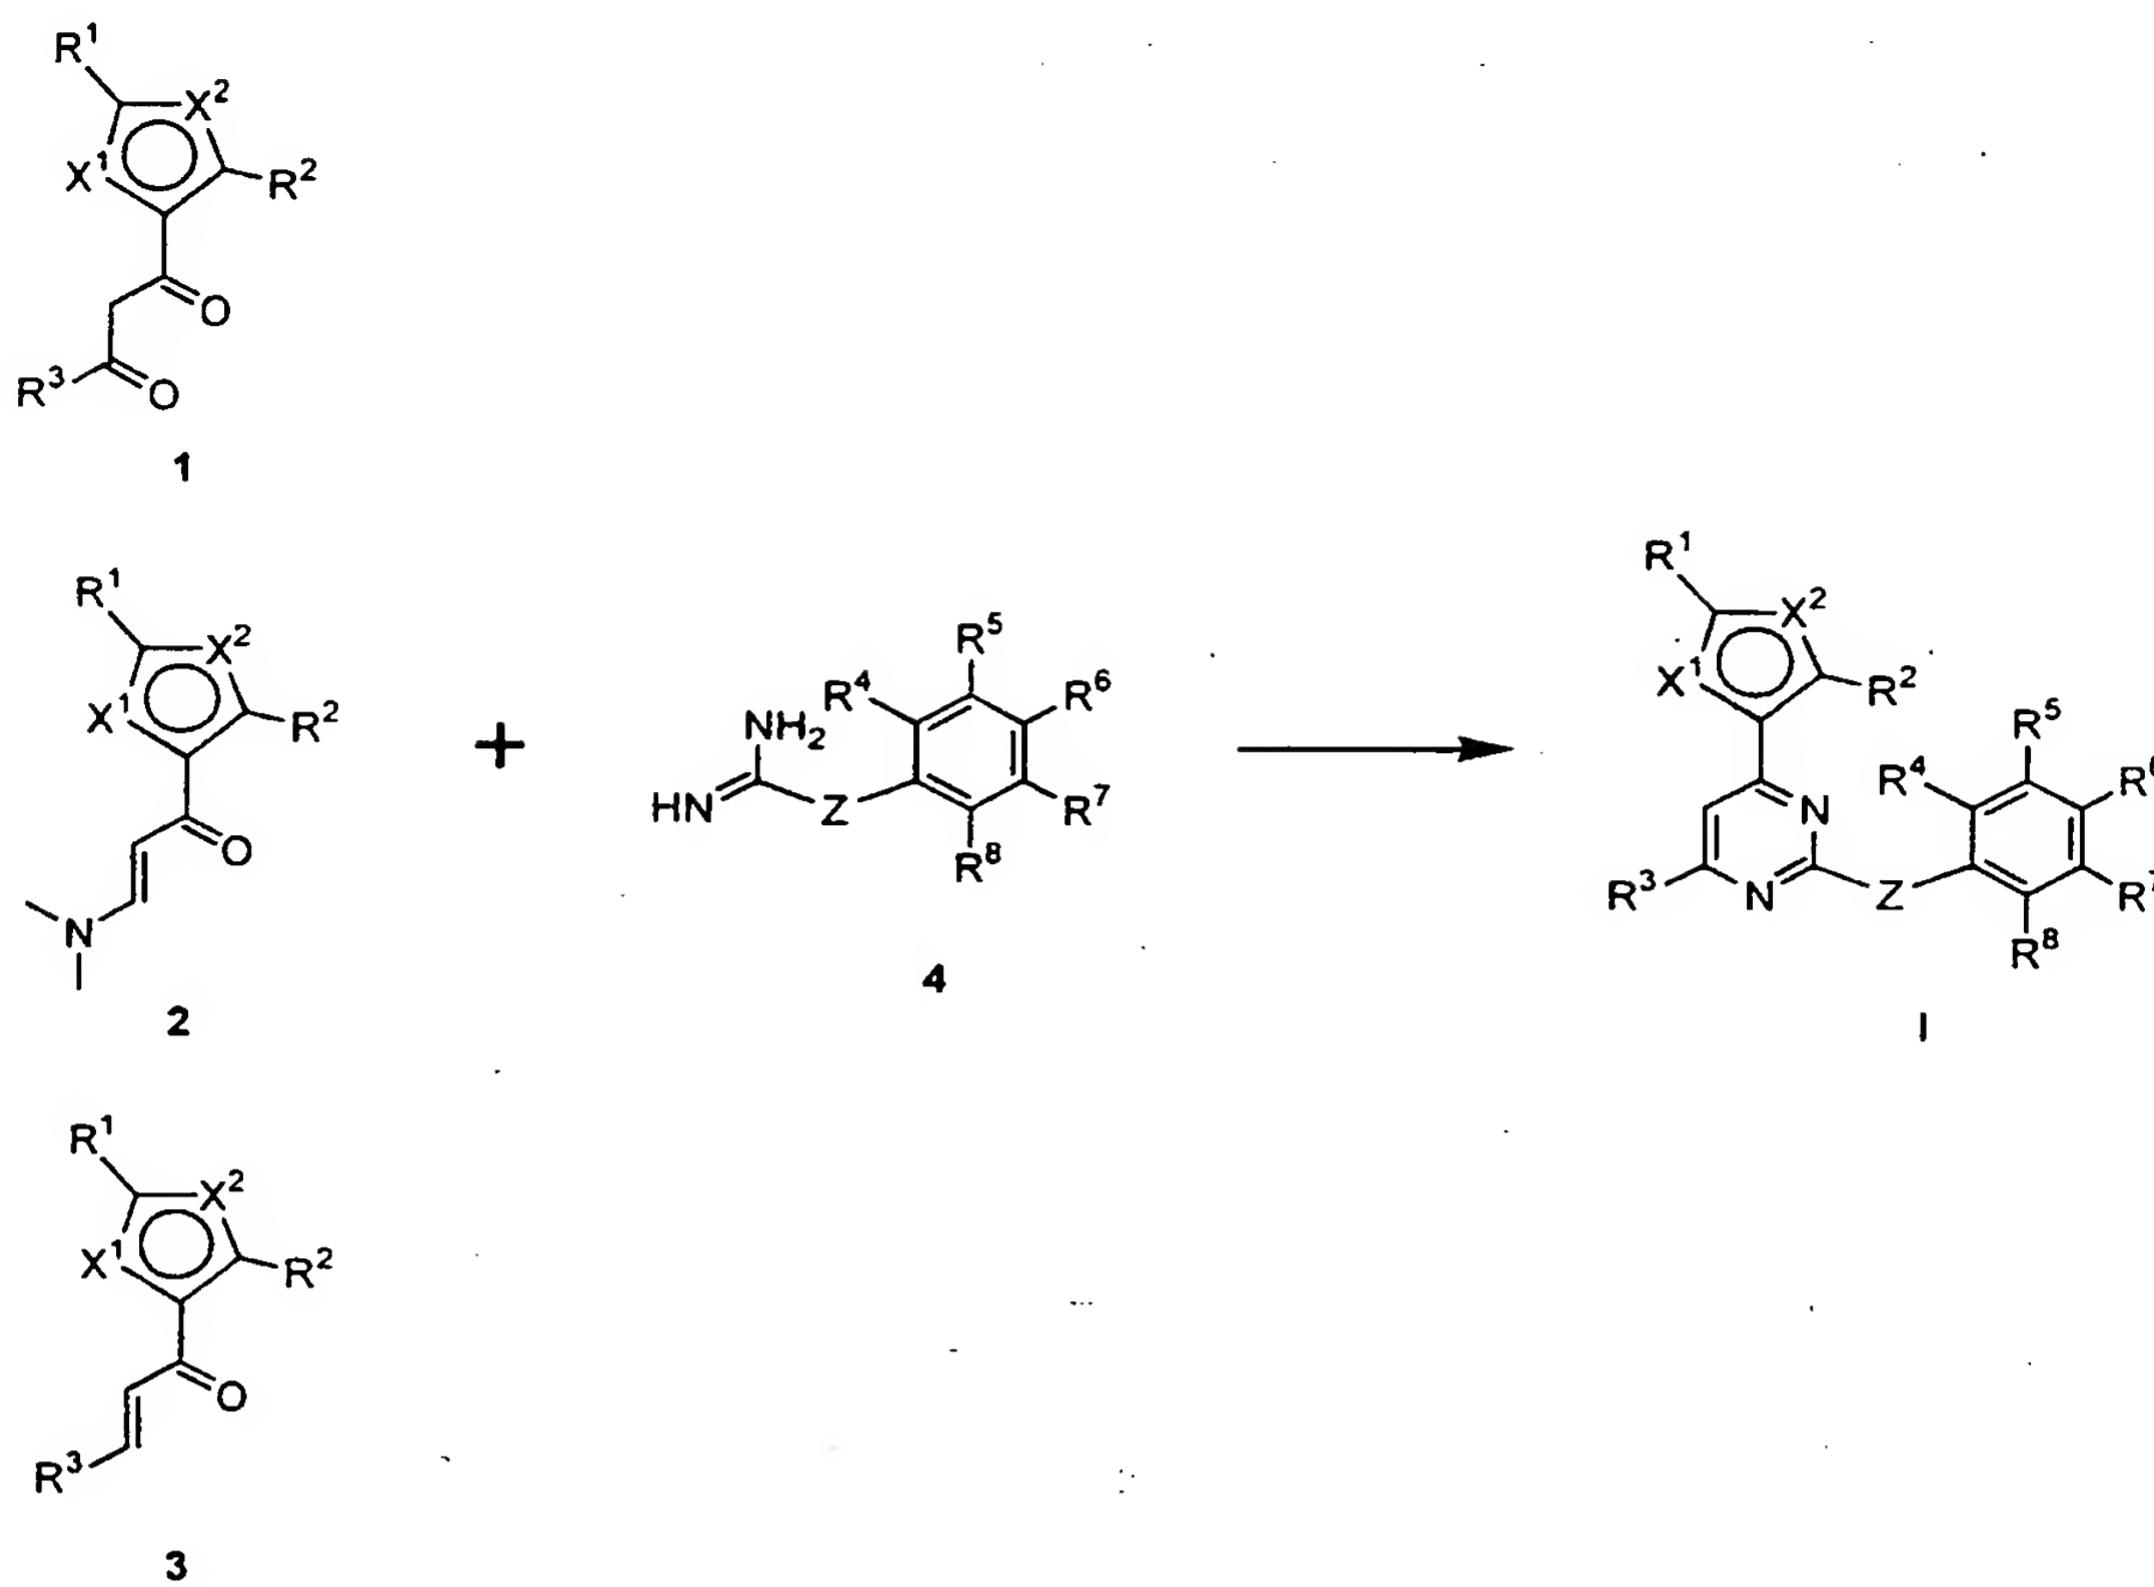

Numerous combinations are used in current treatments of cancer and leukemia. A more extensive review of medical practices may be found in "Oncologic Therapies" edited by E. E. Vokes and H. M. Golomb, published by Springer.

15      Beneficial combinations may be suggested by studying the growth inhibitory activity of the test compounds with agents known or suspected of being valuable in the treatment of a particular cancer initially or cell lines derived from that cancer. This procedure can also be used to determine the order of administration of the agents, i.e. before, simultaneously, or after delivery. Such scheduling may be a feature of all the 20 cycle acting agents identified herein.

Suitable anti-proliferative agents that may be used in combination with at least one compound of the present invention include: DNA damaging agents, anti-metabolites, anti-tumour antibiotics, natural products and their analogues, dihydrofolate reductase 25 inhibitors, pyrimidine analogues, purine analogues, cyclin-dependent kinase inhibitors, thymidylate synthase inhibitors, DNA intercalators, DNA cleavers, topoisomerase inhibitors, anthracyclines, vinca drugs, mitomycins, bleomycins, cytotoxic nucleosides, pteridine drugs, diynenes, podophyllotoxins, platinum containing drugs, differentiation inducers, and taxanes. Particularly useful members

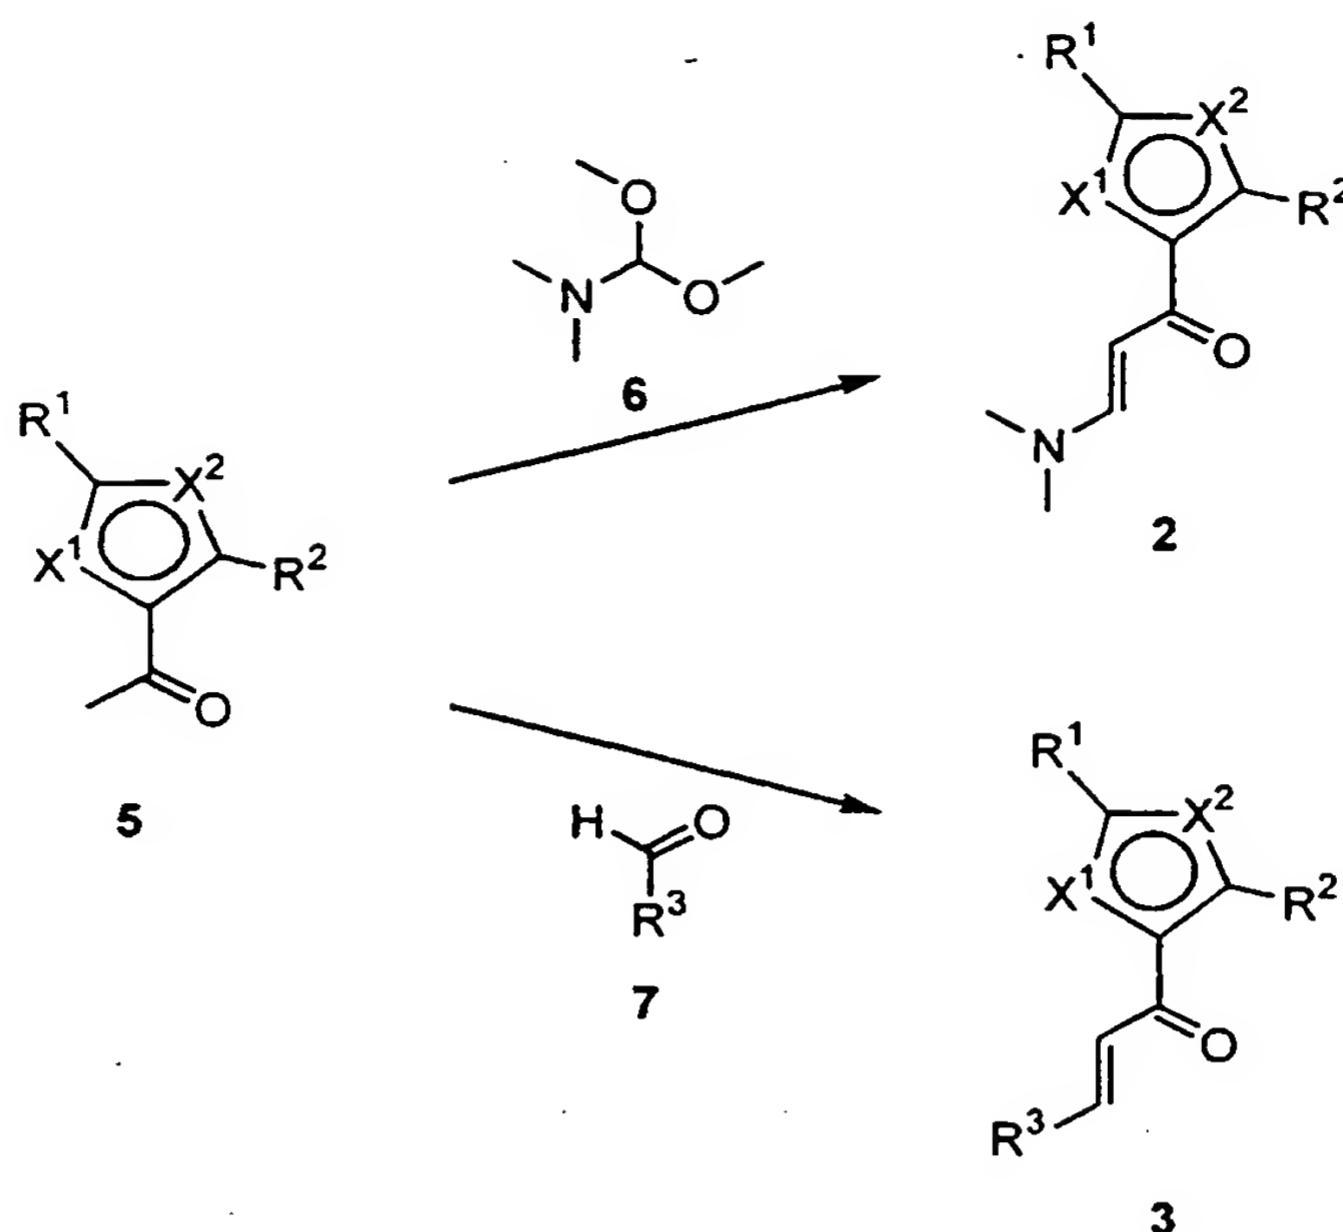

of those classes include, for example, methotrexate, methopterin, dichloromethotrexate, 5-fluorouracil, 6-mercaptopurine, tri-substituted purines such as olomoucine, roscovitine, bohemine and purvalanol, flavopiridol, staurosporin, cytosine arabinoside, melphalan, leurosine, actinomycin, daunorubicin, doxorubicin, 5 mitomycin D, mitomycin A, carminomycin, aminopterin, talysomycin, podophyllotoxin (and derivatives thereof), etoposide, cisplatin, carboplatinum, vinblastine, vincristine, vindesin, paclitaxel, docetaxel, taxotere retinoic acid, butyric acid, acetyl spermidine, tamoxifen, irinotecan and camptothecin. Most preferably the drug moiety is selected from methotrexate, podophyllotoxin (and derivatives thereof), 10 etoposide, camptothecin, paclitaxel, doxorubicin, roscovitine and bohemine.

The compounds of this invention (I) can be synthesised, for example, by an adaptation of the Traube synthesis (A.R. Katritzky, I. Taher, *Can. J. Chem.* 1986, 64, 2087 and references cited therein), *i.e.* by condensation between 1,3-dicarbonyl compounds 1 or 15 acrylates 2 or 3, and amidine 4, as shown in *Scheme 1*.

Scheme 1

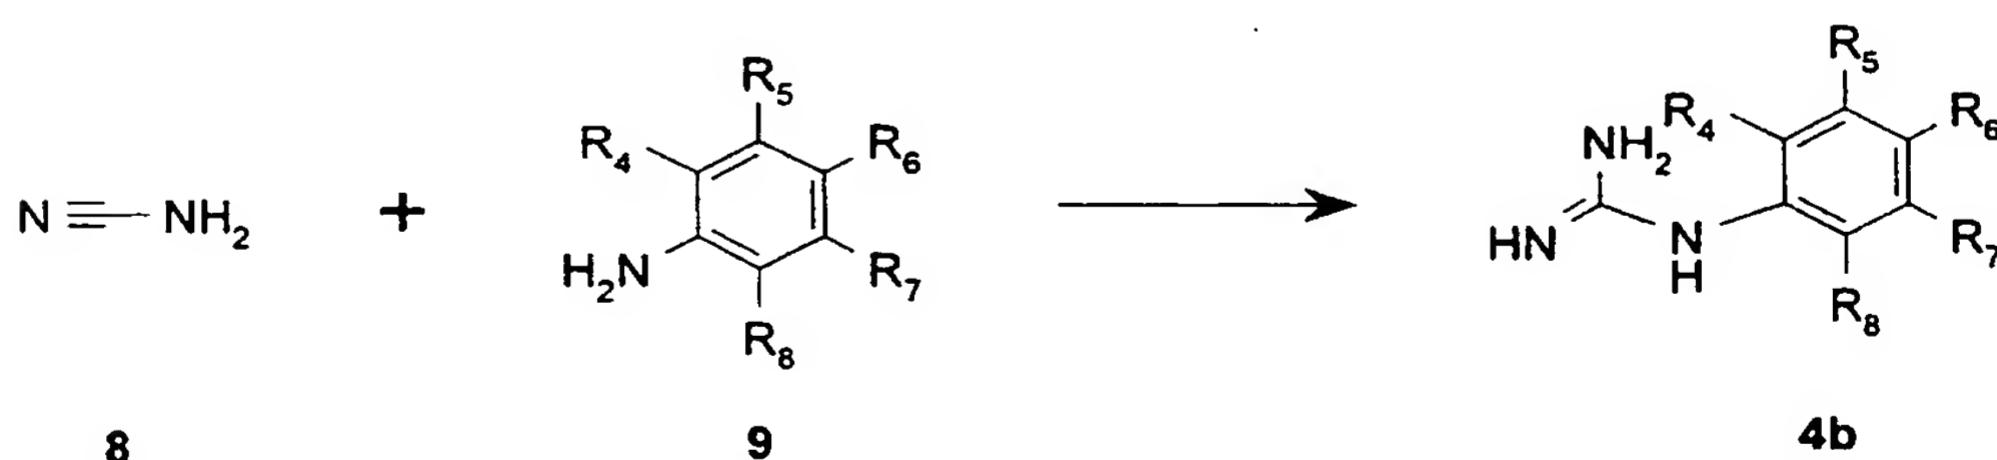

5 The dicarbonyl compounds 1 in turn can be prepared by many methods known in the art (J. March, *In: Advanced Organic Chemistry: Reactions, Mechanism, and Structure*, 4<sup>th</sup> Ed., John Wiley & Sons, Inc., New York, 1992, p. 1283). Acrylates 2 and 3, which are particularly suitable for the purposes of this invention, are obtained from heterocyclic methyl ketones 5 by condensation with dimethylformamide 10 dimethylacetal 6 and aldehydes 7 respectively, (Scheme 2).

Scheme 2

The diamino compounds **4** will be amidines **4a** or guanidines **4b**, depending on the 5 definition of **Z** in general structure **I**. Amidines ( $\text{HN}=\text{CRNH}_2$ ) can be obtained from readily available amine precursors by condensation with *e.g.* ketenimines, or by addition of ammonia to suitable nitriles or imidates. Guanidines **4b** (*Scheme 3*) can be elaborated by a number of methods known in the art. For the purposes of this invention, the most useful route is amination of cyanamide **8** with anilines **9**.

10

Scheme 3

Alternatively, compounds of general structure I can be obtained from suitable pyrimidine precursors directly, *e.g.* from 2,4-disubstituted (halogen, amine, *etc.*) pyrimidines by successive substitution reactions.

### Example 23

20 Kinase specificity of selected compound

Selected compounds from the above examples were investigated for their kinase selectivity. A panel of protein kinases, including the CDKs relevant to the present invention, as well as a representative number of functionally unrelated kinases, were used.

25

Assays for CDK4/Cyclin D1, CDK2/Cyclin E, CDK1/Cyclin B kinase may be carried out by monitoring phosphorylation of GST-Rb in an appropriate system. Thus, GST-Rb phosphorylation, induced by CDK4/Cyclin D1, CDK2/Cyclin E or CDK1/Cyclin B is determined by incorporation of radio-labeled phosphate in GST-Rb(772-928) 30 using radiolabelled ATP in 96-well format *in vitro* kinase assay. The phosphorylation

reaction mixture (total volume 40  $\mu$ l) consisted of 50 mM HEPES pH 7.4, 20 mM MgCl<sub>2</sub>, 5 mM EGTA, 2 mM DTT, 20 mM  $\beta$ -glycerophosphate, 2 mM NaF, 1 mM Na<sub>3</sub>VO<sub>4</sub>, Protease Inhibitors Cocktail (Sigma, see above), BSA 0.5mg/ml, 1  $\mu$ g purified enzyme complex, 10  $\mu$ l of GST-Rb-Sepharose beads, 100  $\mu$ M ATP, 0.2 $\mu$ Ci <sup>32</sup>P-ATP. The reaction is carried out for 30 min at 30°C at constant shaking. At the 5 end of this period 100  $\mu$ l of 50 mM HEPES, pH 7.4 and 1 mM ATP is added to each well and the total volume transferred onto GFC filtered plate. The plate is washed 5 times with 200  $\mu$ l of 50 mM HEPES, pH 7.4 and 1 mM ATP. To each well were 10 added 50  $\mu$ l scintillant liquid and the radioactivity of the samples is measured on Scintillation counter (Topcount, HP). The IC<sub>50</sub> values of different peptides were calculated using GraFit software.

Alternatively, CDK2/cyclin A kinase assays may be performed in 96-well plates using recombinant CDK2/cyclin A. Assay buffer consisted of 25 mM  $\beta$ -glycerophosphate, 15 20 mM MOPS, 5 mM EGTA, 1 mM DTT, 1mM NaVO<sub>3</sub>, pH 7.4, into which is added 2 – 4  $\mu$ g of CDK2/cyclin A with substrate pRb(773-928). The reaction is initiated by addition of Mg/ATP mix (15mM MgCl<sub>2</sub>, 100  $\mu$ M ATP with 30-50 kBq per well of  $[\gamma$ -<sup>32</sup>P]-ATP) and mixtures incubated for 10 – 30 min, as required, at 30 °C. Reactions were stopped on ice, followed by filtration through p81 filterplates (Whatman 20 Polyfiltrronics, Kent, UK). After washing 3 times with 75 mM orthophosphoric acid, plates were dried, scintillant added and incorporated radioactivity measured in a scintillation counter (TopCount , Packard Instruments, Pangbourne, Berks, UK).

PKC $\alpha$  kinase activity may be measured by the incorporation of radio-labeled 25 phosphate in Histone 3, as described. The reaction mixture (total volume 65  $\mu$ l) consist of 50 mM Tris-HCl, 1 mM Calcium acetate, 3 mM DTT, 0.03 mg/ml Phosphatidylserine, 2.4  $\mu$ g/ml PMA, 0.04% NP40, 12 mM Mg/Cl, purified PKC $\alpha$  - 100 ng, Histone 3, 0.2mg/ml, 100  $\mu$ M ATP, 0.2  $\mu$ Ci  $[\gamma$ -<sup>32</sup>P]-ATP. The reaction is carried over 15 min at 37°C in microplate shaker and is stopped by adding 10  $\mu$ l 75

mM orthophosphoric acid and placing the plate on ice. 50  $\mu$ l of the reaction mixture is transferred onto P81 filterplate and after washing off the free radioactive phosphate (3 times with 200  $\mu$ l 75 mM orthophosphoric acid per well) 50  $\mu$ l of scintillation liquid (Microscint 40) were added to each well and the radioactivity is measured on 5 Scintillation counter (Topcount, HP).

For use in said assays CDK2 and/or PKC may be obtained from available sources or produced by recombinant methods as described. His-tagged CDK2/Cyclin E and CDK1/Cyclin B may be co-expressed and PKC $\alpha$  singularly expressed in Sf 9 insect 10 cells infected with the appropriate baculovirus constructs. The cells are harvested two days after infection by low speed centrifugation and the proteins purified from the insect cell pellets by Metal-chelate chromatography. Briefly, the insect cell pellet is lysed in Buffer A (10 mM Tris-HCl, pH 8.0, 150 mM NaCl, 0.02% NP40 and 5 mM  $\beta$ -mercaptoethanol, 1 mM NaF, 1 mM Na<sub>3</sub>VO<sub>4</sub> and Protease Inhibitors Coctail 15 (Sigma) containing AEBSF, pepstatin A, E 64, bestatin, leupeptin) by sonication. The soluble fraction is cleared by centrifugation and loaded onto Ni-NTA-Agarose (Quiagen). Non bound proteins were washed off with 300 mM NaCl, 5-15 mM Imidazole in Buffer A and the bound proteins eluted with 250 mM Imidazole in Buffer A. The purified proteins are extensively dialyzed against Storage buffer (20 20 mM HEPES pH 7.4, 50 mM NaCl, 2 mM DTT, 1 mM EDTA, 1 mM EGTA, 0.02% NP40, 10% v/v Glycerol) aliquoted and stored at -70°C. PKC- $\alpha$  - 6 x His may be purified the same way but using different buffers- 50 mM NaH<sub>2</sub>PO<sub>4</sub>, pH 8.0 and 0.05% Triton X-100 instead of Tris and NP40 respectively.

25 The results in the Table 1 below show that the compounds in question exhibit a high degree of selectivity for inhibition of CDKs.

Example 24Anti-proliferative effect of selected compounds

Selected compounds from the above examples were subjected to a standard cellular proliferation assay using a range of different human tumour cell lines. Standard 72-h MTT (thiazolyl blue; 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyltetrazolium bromide) assays were performed (Haselsberger, K.; Peterson, D. C.; Thomas, D. G.; Darling, J. L. *Anti Cancer Drugs* 1996, 7, 331-8; Loveland, B. E.; Johns, T. G.; Mackay, I. R.; Vaillant, F.; Wang, Z. X.; Hertzog, P. J. *Biochemistry International* 1992, 27, 501-10).

Human tumour cell lines were obtained from the ATCC (American Type Culture Collection, 10801 University Boulevard, Manassas, VA 20110-2209, USA).

The results in Table 3 below illustrate the anti-proliferative effect of compounds described in this application.

5 The following examples indicate the ability of some compounds to induce cell cycle arrest and apoptosis in human tumour cells.

Example 25Induction of mitotic arrest and apoptosis in human tumour cells

Human osteosarcoma tumour cells (Saos-2) were treated with 1  $\mu$ M of compound 28 for 48 h. The accumulation of mitotic cells and appearance of apoptotic cells was 5 observed by phase-contrast microscopy (Figure 1). Compound 28-induced accumulation of mitotic cells was further quantified using mitotic index HitKit (Cellomix).

Example 26

10 The effect of compound 28 on the mitotic index was studied using mitotic index HitKit (Cellomix). Vinblastine was used as control in the experiments. Plates of A549 cells were prepared as instructed in the mitotic index HitKit and the results obtained are shown in the Figures 3 and 4.

15 Example 27

Figure 5 shows the effect of compound 28 on the mitotic index. The data shown in Figure 5 demonstrate the effects of the compounds tested on the percentage of mitotic cells observed in 6 fields within each well. Compound 28 increased the percentage of mitotic cells from 2.6% (data not shown) in untreated wells to a maximum of 17% at a 20 concentration of 4.4 $\mu$ M. Above this concentration a decrease in the number of mitotic cells is observed which correlates with a decrease in the total number of cells. This indicates that toxicity is occurring and that cells are detaching from the bottom of the plate. Vinblastine increases the percentage of mitotic cells to a maximum of 31% at a concentration of 22nM with toxicity being seen again above this concentration.

25

Example 28

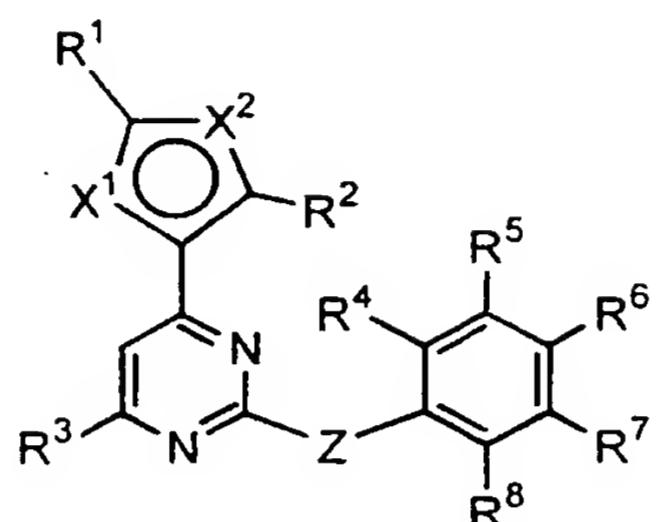

In addition to the induction of apoptosis some of the compounds of the invention are capable of inducing forms of programmed cell death that is distinct from apoptosis by the criteria of morphology. The induction of programmed cell death by compound 28,

characterised by cytoplasmic vaculation, is shown in Figure 6. Human lung carcinoma cells (A549) were treated for 16 h with 10  $\mu$ M compound 28. Extensive cytoplasmic vaculation is observed in the treated cell (A) but not in the control cells (B).
